

SYSTEM AND METHOD FOR RETREIVING DEVICE INFORMATION

ABSTRACT OF THE DISCLOSURE

A remote system and method are used with a gaming system. The gaming system includes at least one electronic gaming device. A host computer is coupled to the at least one electronic gaming device by a network. The host computer includes a database for maintaining information related to the at least one electronic gaming device. A remote device receives identification information input by a user. A remote network interface is coupled to the remote device for receiving the identification information from the remote device, retrieving device information from the database as a function of the identification information, and returning the device information to the remote device.
